TC172 FOR DRY CONCRETE SURFACE

Temafloor 25 Clear
Temafloor PU

Coating system TC172 is suitable for new and old concrete floors exposed to moderate chemical and mechanical stress in industrial and storage facilities, repair shops; e.g. process or paper machine units and corridors. Good resistance to abrasion and different chemicals, and dilute solutions of non-oxidizing acids, alkali and salt solutions. Heat resistance in immersion + 60 ºC.

Stress categories/durability according to PSK 2703

Stress category BC4
High mechanical stress, eg. constant forklift traffic and point load stress. Withstands stress from splashes of process chemicals < 30 ºC. Coating appearance grade Ps2.

Marking of paint systems according to standard PSK 2703 e.g. TC172-PSK 2703/FS3.2 PUR500-D/GD2

COLOURS
Grey, TVT 0229.
**SURFACE PREPARATION**

**Stress category BC3, preparation grade GD2 (PSK 2703)**
Remove oil, grease, chemicals and other impurities from the surface with a suitable method. Remove old coating, laitance and peeling paint layer from the floor surface so that the fine aggregate is exposed throughout. At day-work joints, expansion joints, floor gullies and corner reinforcements bevel the edges of concrete substrate slabs 30 to 70 mm for the entire length of the joint. Clean holes and cracks in the surface before coating and fill them with a filler screed compatible with the coating system.

**Stress category BC4, preparation grade GD2 (PSK 2703)**
Remove oil, grease, chemicals and other impurities from the surface with a suitable method. Remove old coating and surface layer from the floor surface so that the coarse aggregate is exposed throughout. At day-work joints, expansion joints, floor gullies and corner reinforcements bevel the edges of concrete substrate slabs 30 to 70 mm for the entire length of the joint. Clean holes and cracks in the surface before coating and fill them with a filler screed compatible with the coating system.

**APPLICATION CONDITIONS**

**Dry concrete surface TC172**
The relative humidity of the concrete should not exceed 97 %. The temperature of the ambient air, surface or coating should not fall below +15 ºC during application or drying. Relative humidity of air should not exceed 80 %.

**APPLICATION**

**PRIMING**
Prime using 30 - 50 % with Thinner 1061 thinned Temafloor 25 Clear polyurethane varnish. Pour the mixture onto the floor and apply as much as is needed to impregnate the surface. If necessary, repeat the priming to get a non-porous surface. Subsequent treatment may be carried out after 2 h using "wet-on-wet" technique. A porous priming coat will result in holes and air-bubbles in a finished coat. Scatter sand on the fresh primer coat to ensure the screed adhesion.

**PATCHING**
Patch pot-holes and cracks with unthinned Temafloor 400 epoxy varnish and dry, clean sand. Mixing ratio e.g. 1 part by volume of epoxy mixture and 1 - 2 parts by volume of sand of grain size 0.1-0.6 mm. Grind the patched areas before overcoating.

**COATING**
Overcoating may be carried out not earlier than 6 hrs and not later than 24 hrs after priming and patching. If the primed surface is not overcoated within 24 hrs, it should be abraded. Pour the coating mixture onto the floor and spread it with a trowel and a roller. Recommended thickness of a layer is 0.5 - 2.0 mm. Level the screed with a spiked roller approx. 10 - 20 min after application. Spiked roller helps removing air bubbles from the coating.

**TOP LACQUERING**
Top lacquering may be carried out if necessary using Fontedur FL Matt lacquer.

**PRODUCT INFORMATION**

More detailed information in respective data sheets.
